

MillieMoon

Tablekeeper factory

Seven BAND seats are configured to build and review four incremental application stages.

7

registered roles

1

active model seat at a time

PM / Architect / Designer / Backend / Frontend / QA / Reviewer

All seven use Codex 0.160.0 with gpt-6-astra. BAND SDK 4.0.0.

Complete handoffs and an independent gate

1 Assignment

PM sends full requirements, revision, owner and limits.

2 Receipt

The peer checks every part and acknowledges its digest.

3 Candidate

The owner returns a commit with commands and results.

4 Release gate

An independent Reviewer accepts or returns defects.

The screenshot shows a chat window titled "Sessions > MillieMoon · Tablekeeper · Run 5". The chat history includes a message from "Factory PM" dated October 4, 2026 at 9:25:28 PM UTC, stating that QA's early planning is accepted and 53 boundary classes and 11 representative HTTP test groups are committed. It also mentions that the architecture now has a complete four-part assignment and sole writer lease, starting from a specific SHA-256 hash. A subsequent message from "Factory Architect" dated October 4, 2026 at 9:27:28 PM UTC confirms the receipt of all 4/4 parts and verified concatenated UTF-8 payload SHA-256 against the saved delivery. The architect also mentions that the assigned checkout is clean and that they are evaluating Python + SQLite + zoneinfo as a smaller API core while retaining React/Vite for Stage 2. The chat interface includes a search bar, filters for "Event type" and "Sender", and a status bar at the bottom showing "Stop all" and "Working" buttons.

Actual Run 5 room still, 21:30–21:32 UTC.
The Architect confirms all 4 parts and the payload digest.

Two defects closed in host checks

Independent QA recheck on candidate 4026ec7

UTC	Candidate	Recorded event
22:31	68afbfb8	PM receives two independently reproduced valid-input defects.
22:41	4026ec7	Backend returns repair 7e82648. PM acknowledges its full handoff.
22:48 / 22:50	4026ec7	QA closes both defects. PM acknowledges the matching digest.

5 focused groups

11 baseline groups

7 additional groups

All passed on host Python 3.13.5. These overlapping groups do not establish stage acceptance.

Two operator infrastructure interventions

The run includes human infrastructure work after dispatch.

UTC	Global VM cap	Observed action
22:07	1,024 MiB	Architecture review container exits after an out-of-memory kill.
22:31	4,096 MiB	Operator restarts OrbStack and restores the same two containers.
22:49	2,048 MiB	User requests the lower cap. Operator restarts and restores again.

The 2 GiB global cap also covers VM and daemon overhead.

Application state continuity and full 2 GiB application capacity remain unverified.

Stage 1 rejected on three defect families

Independent Reviewer / 4026ec7 / 23:01 UTC

Confirmed finding	Expected behavior	Observed behavior
Reset numeric fields use wrong JSON types	400	422
Import contains corrupted completed receipts	Reject invalid state	204, then invalid replay
Fixture capacity has 5,000 decimal digits	Accept valid capacity	400

31/61 focused HTTP assertions passed; 30 failed.

Two host mechanism groups passed. Stages 2–4 remain incomplete.

Evidence still needed for the final package

Final verification

Independent gate for a repaired candidate
Fresh-clone package and isolated checks
Clean startup and real Stage 2–4 UI verification
Final measured time and usage

Submission artifacts

Genuine final full-session room export
Participant-reviewed README and FACTORY
Public judge access after authorization
Submission receipt after authorization

The participant deferred video. Real room footage remains required.

AI-assisted draft for participant review. Final outcomes and costs remain pending.
